**TITLE : TITLE SUPER TRANSMISSION
SYSTEM**

ABSTRACT : PURPOSE: To execute multi-lingual title super transmission in a system of an existing satellite broadcast without remarkable circuit revision by using an independent data area of a voice channel of a satellite broadcast or the like so as to send a packet for plural language titles, allowing a receiver side to extract a title packet of a language designated by a viewer and synthesizing the extracted packet with the video signal.

CONSTITUTION: Title packets in plural languages are sent by using an independent data area of a voice channel in a satellite broadcast or the like. When a viewer uses a switch 33 of a receiver side to select a desired language, a designation packet extract section 32 reads a predetermined control section of a title packet to extract a title packet in a designated language. A control section 34 reads a predetermined control part of the title packet outputted from the designation packet extract section 32 and controls a synthesis section 23 at which position the title is to be arranged. A data conversion section 35 reads language information data of the title packet outputted from the designation packet extract section 32, converts the data into a superimposing signal and it is outputted to the synthesis section 23.
